Precise results with electrosurgical tools are achieved by confining the electrical current to a specific and focused geometry. With this in mind, Utah Medical Products designed specialty precision electrosurgical electrodes that improve system performance and achieve excellent results for a range of plastic, cosmetic and reconstructive surgical procedures.

**EPITOME® SCALPEL**

The patented Epitome® Scalpel electrode uses a fine wire element at the edge of a non-conductive ceramic core to focus the current at the edge of the blade, resulting in clean tissue dissection with minimal thermal injury. Comparative histology (at right) of porcine skin incisions shows that Epitome (1) yields significantly reduced thermal injury and fibroplasia as compared to a standard electrosurgical tip incision (2). Providing the cutting precision exceeding that of a cold scalpel, cosmetic results comparable to a cold scalpel, and hemostasis of the electrosurgical modality, only Epitome can potentially provide:

- Rapid and precise cutting through dense breast tissue during reduction mammaplasty and mastectomy
- Rapid elevation of the abdominal flap that often eliminates seroma in abdominoplasty
- Reduced thermal tissue injury, yet easily dissects adipose tissue without increased power settings
- Minimized necrotic zone for reduced circulation complications in flaps

**Surgeon Praise for Epitome**

"I get excellent results when I use Epitome. Not only do I get a precise cut during mammaplasty and abdominoplasty, but my procedure times are often reduced and I do not experience problems related to thermal injury or tissue necrosis."  
Curtis Wong MD, Plastic Surgeon, Redding, CA

"I have never used a tip that cuts with such laser-like precision. The cutting motion is extremely smooth and effortless. It cuts through breast tissue like a scalpel but provides simultaneous hemostasis."  
Scott W. Barttelbort MD, Plastic and Reconstructive Surgeon, San Diego, CA

"With Epitome, I see less blood loss and fewer wound healing problems, and I have also reduced my mastectomy procedures by 30 minutes."  
Lois M. Sabolik MD, General Surgeon, Orange, NY

"Epitome is an ingenious product! I see a stark difference in its ability to cut through fatty tissue, and I get less tissue trauma than with a standard electrosurgical blade tip."  
Jerry W. Bains MD, Plastic and Reconstructive Surgeon, Phoenix, AZ

"Epitome represents a notable advance in electrosurgical technology. It provides a superior surgical tool compared with earlier model electroscalpels in terms of handling and control and exhibits measurable improvements in post-operative incisional healing closely approaching characteristics of the traditional [brand name] cold scalpel blade."  

**OptiMicro Needle**

The OptiMicro™ Needle ultra-fine tip electrosurgical electrodes are designed to provide precise dissection without adverse thermal effects to yield excellent cosmetic results for small-scale procedures. These micro-needles have the finest geometry available. Because of their extremely small surface area, high current densities are achieved with very low power settings.

Utah Medical Products designed and manufactures the OptiMicro Needle to exacting standards, providing the discerning surgeon with important clinical benefits:

- Distal end malleability to aid with tip visualization
- Short tip to limit peripheral injury and to limit depth of cut
- Requirements: Minimize scarring
- Electrode: OptiMicro CBE-200
- Settings: 25-50 W, Blend 1

**Microdissection with Unparalleled Results**

- Hemostasis while cutting
- Minimize scarring
- Electrode: OptiMicro CBE-200
- Settings: 25-50 W, Blend 1

- Reduced and I do not experience problems related to thermal injury or tissue necrosis.

- Minimize scarring
- Reduced thermal tissue injury, yet easily dissects adipose tissue without increased power settings
- Minimized necrotic zone for reduced circulation complications in flaps

**Abdominoplasty**

- Requirements: Quickly elevate abdominal flap
- Electrode: Epitome CBE-100 or CBE-150
- Settings: 50-70 W, Blend 2, Blend 3, or Coag

**Panniculectomy**

- Requirements: Minimize Scarring
- Electrode: Epitome CBE-100 or CBE-150
- Settings: 40-70 W, Blend 1 or 2

**Blepharoplasty**

- Requirements: Minimize flap damage
- Electrode: Epitome CBE-200
- Settings: 25-40 W, Blend 1

**Reconstruction Mammaplasty**

- Requirements: Quickly dissect dense tissue
- Electrode: Epitome CBE-100 or CBE-150
- Settings: 25-50 W, Blend 1

**Capsulectomy**

- Requirements: Minimize necrotic zone
- Electrode: Epitome CBE-200
- Settings: 25-50 W, Blend 1

**Rhytidectomy**

- Requirements: Minimize necrotic zone
- Electrode: Epitome CBE-200
- Settings: 25-50 W, Blend 1

Power settings may vary, depending on system used and individual preference and technique.
